

Does “Confirm items” fill your Allocations & Limits?

1. Confirm items — commits the interpreted instructions

Produces a 📡 monitoring watchlist (triggers) and guidance folded into the proposal. It writes into NO field.

2. Apply to allocation targets — the second, separate click

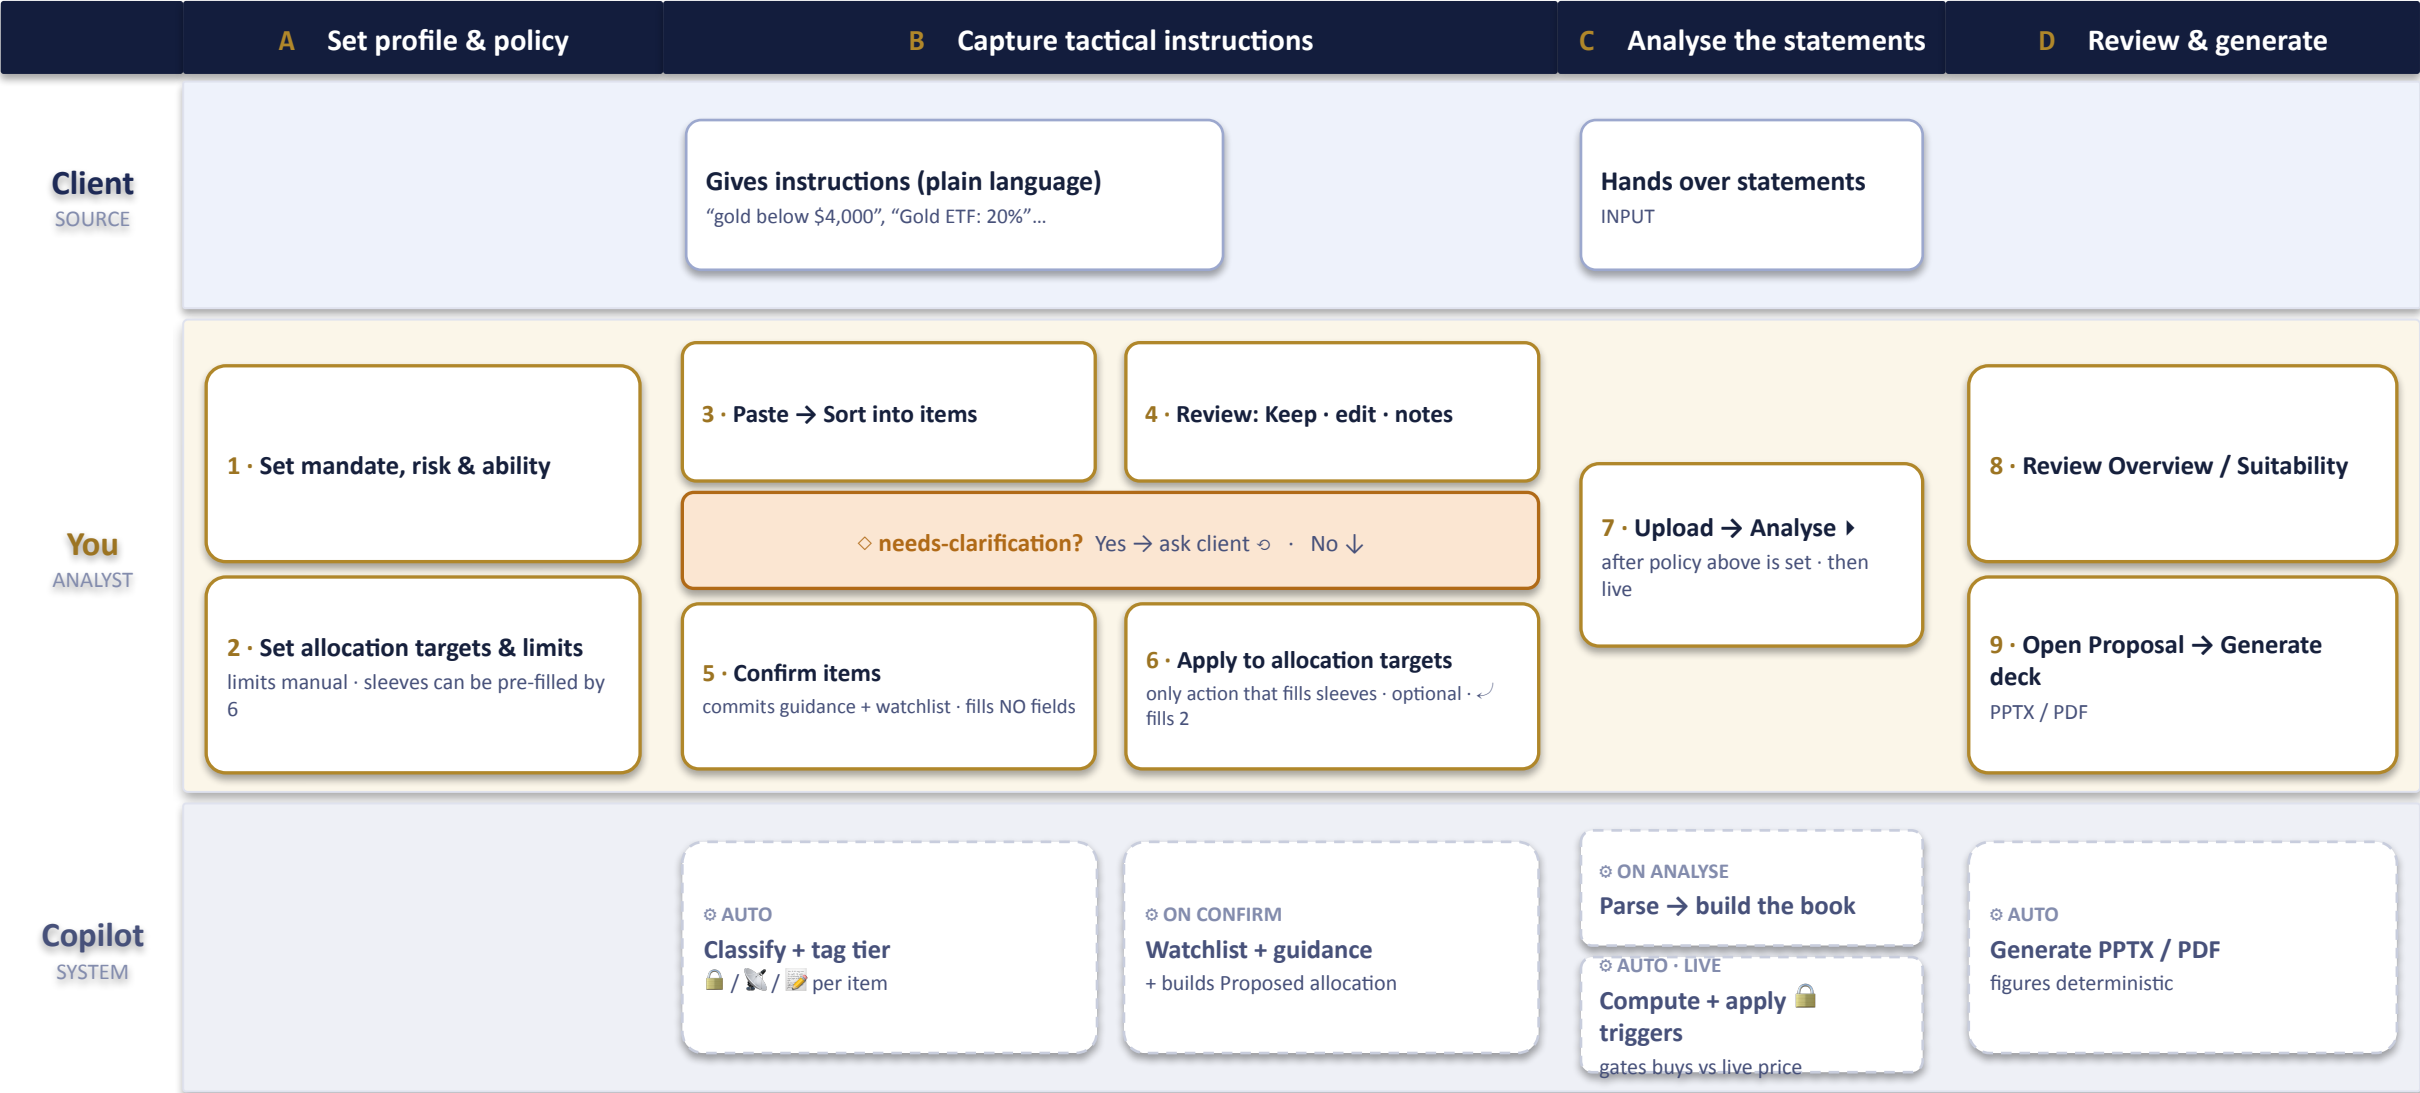

The ONLY action that fills the allocation sleeves. Appears only if the client stated target weights (“Gold ETF: 20%”). You still verify and adjust.

3. Limits — band tolerance · liquidity · FX · position caps

Always MANUAL — never extracted from the instructions or auto-filled.

Order, Analyse & the v8 exception: Set the mandate / risk / allocations first, then Analyse — so the first read reflects the policy. Confirm still fills no field; the one exception is a 🔒 enforced price trigger (e.g. “gold below \$4,000”), which gates a rebalance buy at Analyse using a sourced live price — it can flag or hold a trade, never invent one.

Tactical instructions — who does what, and when

Recommended order: set the policy (1–6) first, then Analyse (7). Confirm (5) fills no fields; allocations only via Apply (6); limits manual. v8: a 🔒 enforced price trigger gates a buy at Analyse (vs a sourced live price): 🗑 / 📄 items never touch a figure.
